Helping Hally	Sam was sitting on the couch, watching television. His mom walked in the door with Hally, their dog. Hally walked right over to Sam and licked him hello. "Hi Hally! How was your checkup?" Sam asked. Hally just looked at Sam. "We have to help Hally," said Mom. "Help her how?" asked Sam. "Do you remember when we went to pick up Hally from her litter? We picked her because she looked like her mom. She is brown with spots, with long ears, and she was energetic, so we thought she'd be strong, like her mom. But how does she look now?" Mom asked. "Well," thought Sam, "She's still brown with spots and long ears, but she's not very energetic or strong anymore." "That's what the vet said, too. We haven't been letting her exercise as much, and we've been feeding her a lot. She would probably look just like her mom now if we had walked her more. We have to start walking her more often, so that she'll stay healthy for a long time. Will you help?" "Sure!" said Sam. He decided that he could play fetch with her every day in the yard, because then she could run and run and run until she was tired. The first day, they only played fetch for about 10 minutes before Hally was tired. But Sam kept playing with her every day. Soon, they could play for an entire half an hour! Hally looked stronger every day, just like her mom. Sam felt great about helping Hally get strong again.
Test 2	When Charles Darwin was born in 1809 science was still in its baby shoes. Chemists were talking about atoms, physicists about energy and electricity. Nobody really knew what it was. By the time he died in 1882 scientists were able to explain light and electromagnetic waves. And, thanks to Darwin, biologists were able to explain how life on Earth developed. Darwin was the best biologist of all times. He was an expert on plants, animals and insects. But he didn't want to be a biologist at first. At school and the university Darwin was just an average student. He read a lot and collected beetles and butterflies. He went to Edinburgh to study

Lesson name	Data
	medicine but soon found out that it wasn't the right thing for him. At Cambridge he met a fellow botanist, John Steven Henslow. Henslow helped him get a job on the exploration ship Beagle. The ship travelled around the world for five years and Darwin learned a lot about the forms of life. When Darwin returned to England he was a well-known scientist who lived an isolated life in the countryside where he did experiments and studied plants and animals. Darwin read a lot of interesting books. One of them influenced him a great deal. A popular economist claimed that when the population grew the people would need more and more food. But there was not enough for everybody, so food would become scarce and not everyone could survive and have children. Darwin thought that this had to be true for animals and plants as well. Those that had food would survive and the others would die. Charles Darwin-Father of Evolution This helped Darwin solve many questions of life. While many scientists thought that all animals and plants had always been the same Darwin wasn't sure about this. During his voyage on the Beagle he began to think about it.
Test 1	You know that the earth goes around the sun and the moon goes around the earth. You know also perhaps that there are several other bodies which like the earth go around the sun. All these, including our earth, are called planets of the sun. The moon is called a satellite of the earth because it hangs on to it. The other planets have also got their satellites. The sun and the planets with their satellites form a happy family. This is called the solar system. Solar means belonging to the sun, the sun being the father of all planets, the whole group is called the Solar System. At night you see thousands of stars in the sky. Only a few of these are the planets and these are really no called stars at all. Can you distinguish between a planet and a star? The planets are really quite tiny, compared to the stars but they look bigger in the sky because in the sky because they are much nearer to us. Just as the moon which is, really quiet a baby, looks so big because it is quite near to us. But the real way to distinguish the stars from the planets is to see if they twinkle or not. Stars twinkle, planets do not. That is because the planets only shine because they can get the light of our sun. It is only the sunshine on the planets or the moon that we see. The real stars are like our sun. They shine of themselves because they are very hot and bigger as it is nearer and we see it as a great ball of fire. So that our earth belongs to the family of the sun-the solar system. We think the earth is very big and it is big compared to our tiny selves. It takes weeks and months to go from one part of it to another even in a fast train or steamer. But although it seems so big is millions of miles away and the other stars are even further away.
